

Attorney Docket No. LEAP:130US
U.S. Patent Application No. 10/811,336
Reply to Office Action of March 15, 2006
Date: March 21, 2006

Current Status of the Claims

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (currently amended) A microscope comprising
 - a. a microscope stand;
 - b. a focusing device arranged inside the microscope stand
 - c. at least one operating element at a first end and a second end of the focusing device, each of which protrudes through a side wall of the microscope stand;
 - d. a microscope stage moveably mounted to the microscope stand;
 - e. at least one objective which defines in its working position an optical axis, and said at least one operating element of the focusing device effects a relative movement between the microscope stage and the objective;
 - f. an elongated slot provided at each side wall of the microscope stand which allows a change of the position of said at least one operating element in a horizontal and vertical direction; and
 - g. an adjustable stop mechanism to limit the relative movement of the microscope stage in the direction of the optical axis.
2. (original) The microscope as defined in Claim 1, wherein the focusing device is provided with a pivot axis around which the focusing device and consequently said at least one operating element is pivotable so that the position of the operating element is adjustable with respect to a side wall of the microscope stand.
3. (currently amended) The microscope as defined in Claim 1, wherein the focusing device has a first axle defining the first end and the second end on both of which at least one operating element is mounted and a second axle, which is parallel to the first axle.

4. (original) The microscope as defined in Claim 3, wherein the first axle carries a first gear wheel, the second axle carries a gear wheel arrangement and a rocker, and the rotational movement of the first axle is transferred by the first gear wheel to the gear wheel arrangement on the second axle.
5. (original) The microscope as defined in Claim 4, wherein the gear wheel arrangement comprises a first gear wheel and a second gear wheel arranged coaxially and the first gear wheel has a larger diameter than the second gear wheel.
6. (original) The microscope as defined in Claim 5, wherein the rotational movement of the second gear wheel of the gear wheel arrangement is transferred to a gear rack which moves the microscope stage in the direction of the optical axis of an objective.
7. (original) The microscope as defined in Claim 1, wherein the adjustable stop mechanism comprises a rod, a spring for biasing the rod and a screw for adjusting and fixing a position of the rod.
8. (original) The microscope as defined in Claim 7, wherein a dividing wall element is formed inside the microscope stand and the dividing wall element provides a guide for the screw, the spring and the rod.
9. (currently amended) The microscope as defined in Claim [4] 5, wherein [a] the rocker is provided on the second axle which is operated by a pin which is mounted at the periphery of the first gear wheel of the gear wheel arrangement.
10. (original) The microscope as defined in Claim 4, wherein the rocker is a one piece element which comprises a first arm and a second arm and the second axle is common for both arms.
11. (currently amended) The microscope as defined in Claim 10, wherein the first arm of the rocker is a massive block with a rectangular cross section.

12. (currently amended) The microscope as defined in Claim 10, wherein the second arm of rocker defines a free end which has on opposing sides an S-shaped contour which cooperates with the a pin mounted at the periphery of the a first gear wheel of the gear wheel arrangement.
13. (currently amended) The microscope as defined in Claim 11, wherein the adjustable stop mechanism comprises a rod, a spring for biasing the rod and a screw for adjusting and fixing a position of the rod and wherein the first arm of rocker engages with a surface of the rod an and thereby limits the relative movement of the stage in the direction of the optical axis.
- 14.(currently amended) A focusing device for a microscope comprising:
 - a. at least one operating element attached to a first axle of the focusing device for effecting movement of a microscope stage along an optical axis of the microscope; and,
 - b. an adjustable stop mechanism cooperating with the focusing device to limit the movement of the microscope stage in the direction of the optical axis[.];
wherein a gear wheel is formed on the first axle of the focusing device and a gear wheel arrangement is provided on a second axle; and,
wherein a rocker is provided on the second axle and is operable by a pin which is mounted at the periphery of the first gear wheel of the gear wheel arrangement.
15. (cancelled)
16. (currently amended) The focusing device as defined in Claim ~~15~~ 14, wherein the gear wheel arrangement comprises a first gear wheel with a larger diameter than a second gear wheel wherein the rotation of the gear wheel is transferred to the first gear wheel of the gear

wheel arrangement and the second gear wheel of the gear wheel arrangement transfers its rotational movement to a gear rack which moves the microscope stage in the direction of the optical axis.

17. (withdrawn) The focusing device as defined in Claim 14, wherein the adjustable stop mechanism comprises a rod, a spring for biasing the rod and a screw for adjusting and fixing a position of the rod.

18. (withdrawn) The focusing device as defined in Claim 17 wherein the adjustable stop mechanism is arranged inside a microscope stand, a dividing wall element is formed inside said microscope stand and the dividing wall element provides a guide for the screw, the spring and the rod.

19. (cancelled)

20. (currently amended) The focusing device as defined in Claim 19 14 wherein the rocker is arranged rotatable on the second axle of the focusing device.

21. (currently amended) The focusing device as defined in Claim 15 14 wherein the adjustable stop mechanism comprises a rod, a spring for biasing the rod and a screw for adjusting and fixing a position of the rod and wherein the rocker has a first arm and a second arm and the second arm cooperates with the a pin and the first arm cooperates with the rod of the adjustable stop mechanism.

22. (currently amended) The focusing device as defined in Claim 19 21 wherein the first arm of the rocker is a massive block with a rectangular cross section.

23. (currently amended) The focusing device as defined in Claim 19 21 wherein the second arm of the rocker defines a free end which has on opposing sides an S-shaped contour which cooperates with the pin mounted at the periphery of the first gear wheel of the gear wheel arrangement.

24. (currently amended) The focusing device as defined in Claim 22 wherein the first arm of the rocker engages with a surface of the rod an and thereby limits the relative movement
